Efficient Use of Resources Policy

We are aware that the global environmental problems are primarily caused by the inefficient and incorrect use of natural resources.

For this reason:

- We pay maximum attention to using our resources smartly by taking the efficiency of raw materials, energy and water in all processes under our management into consideration.
- We conduct analysis of needs and risks as part of resource efficiency and try to ensure that scarce and exhaustible resources are used more efficiently.
- We perform awareness-raising activities along with the technological infrastructure to efficiently use the planet and water as the most important elements of our services.
- We prevent wastes by using all inputs of our projects completely.
- In addition to evaluating the wastes and residues of the projects within the recycling system; we pay maximum attention to ensuring that projects are implemented in a way suitable for recycling and used as an input for the circular economy.
