Basic Emission Policy

The Paris Agreement has established a global target to reach net zero emissions until 2050. If we desire to avoid the negative impacts of climate change, we must limit the global average temperature increase to 1.5° C. In this regard, our ultimate goal should be to make a rapid progress towards a net-zero emissions society until 2050.

Akfen Construction implements the following practices within the scope of its management powers in its projects:

- Taking energy efficiency and resource efficiency in the construction of projects into consideration
- Maintaining the innovation approach in construction
- Using recyclable materials
- Performing waste and residue efficiency studies
- Conducting afforestation in the operational areas
- Supporting civil society organizations in relation with afforestation
- Providing relevant information to employees and the supply chain
- Working with the suppliers that will contribute to greenhouse gas emission targets
- Taking emission generation in the arrangement of logistics operations into consideration and working with local producers as much as possible
- Incorporating cyclical economy into business processes for the transition to a low-carbon economy
- Disciplining all operational processes according to international standards to achieve the carbon positive target until 2050
- Determining the targets, commitments and schedule for key emissions
- Developing a technological infrastructure to measure and manage the impact of emissions
- Reporting the NOx, SOx and other particulate emissions and controlling the NOx, SOx and other particulate emissions.
